Table 1: **Original v7 results** (v7 delta-bins only; *not* v6, v7b, or the June rerun): ROC$_G$ and ρ, all four eval-time typicality corrections as separate rows. Sources: **Hyponymy/G2-9b-it** from the complete local-mll table `v7_rosch_all_metrics`; everything else recomputed from the raw `eval_model_sN` pod scores. IFEval split per cell: $_o$=OOD (20 prompts), $_i$=ID (79). **Own-typ ifeval exists only on ID** (own-OOD was never run in v7); base-typ ifeval is OOD. `---`=not on disk in v7. **Provenance by color:** black = original (gemma: pod / local-mll); blue = original HF checkpoint (latkes; qwen ifeval s1/s2 + rosch s1/s7); orange = wandb-rerun checkpoint (qwen originals lost; gemma ifeval own-OOD). **gemma IFEval cells show green=v6/(orange or black)=v7**: green is the legacy v6 (delta-0.15) own-typ value the *paper actually used* (v7 gemma-ifeval did not exist at paper time); the second number is our v7. All epoch 2.
