

qwen Qwen3.5-9B IFEval (OOD) — reproducibility: current rerun vs. independent retrain (v2)

cur = the current wandb rerun (`outputs-rerun-wandb`, in `rerun_only_tables.pdf`); **v2** = a second, independent retrain (`outputs-rerun-wandb-v2`, jobs 44680–44684) with *identical* flags, data, trainer, 3 epochs, and the **qwen35** venv — only the output dirs differ. No fixed seed, so Δ is the natural train-to-train variance. $\Delta = \text{v2} - \text{cur}$; **bold** marks $|\Delta| > 5$. Both baselines are mll reruns (this is *not* a comparison to the original pod/paper). All eval-time typicality variants (own: PMI self / Neg self; base: PMI base / Neg base; + Raw + validator) are present in both runs. Takeaway: SFT/New+fsx/FLORA reproduce within $\sim \pm 2.6$ (incl. the SFT validator); **RankAlign does not** (high run-to-run variance).

Generator (ROC_G, ρ)

Method	eval	ROC_G			ρ		
		cur	v2	Δ	cur	v2	Δ
SFT	Raw	51.4	50.5	-0.8	0.8	2.3	+1.5
