Table 1: **Original v7 results** (v7 delta-bins only; *not* v6, v7b, or the June rerun): ROC_G and ρ , all four eval-time typicality corrections as separate rows. Sources: **Hyponymy/G2-9b-it** from the complete local-mll table `v7_rosch_all_metrics`; everything else recomputed from the raw `eval_model.sN` pod scores. IFEval split per cell: _o=OOD (20 prompts), _i=ID (79). **Own-typ ifeval exists only on ID** (own-OOD was never run in v7); base-typ ifeval is OOD. ---=not on disk in v7. **Provenance by color:** black = original eval (gemma rosch = local-mll; gemma IFEval base = pod; **qwen = the original eval_model.sN pod evals the paper used**, incl. the v7b folder for delta-insensitive SFT/CFT); **orange** = wandb-rerun checkpoint (gemma IFEval own-OOD; qwen rosch s2/s4 — no original on disk). **gemma IFEval cells show green=v6 / v7:** green is the legacy v6 (delta-0.15) own-typ value the *paper actually used* (v7 gemma-ifeval did not exist at paper time); the second number is our v7. All epoch 2.
