Table 1: **Original v7 results** (NOT the wandb rerun): generator metrics ROC_G and Spearman ρ on Hyponymy and IFEval (OOD), reconstructed from the canonical `delta-bins 10 · eval_model_sN` evals on disk (`pod-results-*-20260525.md` + the deduped gemma `gen.roc` cells). All four eval-time typicality corrections are shown as separate rows: *self/neg (own)* = the model’s own typicality (**self-/neg-**); *self/neg-base* = the base model’s typicality (**basetyp-/basetypneg-**). --- = that variant was not computed on disk for that cell. Hyponymy paper numbers were taken from the *own* rows; IFEval from the *base* rows. All cells epoch 2 (paper RankAlign is reported at epoch 1).

Table 2: **Original v7 results**: validator metrics ROC_V, Acc_V on Hyponymy and IFEval (OOD). These are independent of the eval-time typicality correction, so there is no self/neg split. Source as in Table 1. All cells epoch 2.
